

What male humpback whale song chorusing can and cannot tell us about their ecology

Strengths and limitations of passive acoustic monitoring of a vocally active baleen whale

Missing Whales

Maui Nui

Summary/Outlook

Data Collection

- ▶ Passive acoustic monitoring with **E**cological **A**coustic **R**ecorders (EARs)

- ▶ November – May, 2014 - 2018
- ▶ 30s/5min 10% duty cycle
- ▶ Sampling rate: 25-50 kHz
- ▶ RMS SPL (Averages) (from Matlab™)
- ▶ 0-1.5 kHz frequency band

Data Collection

- ▶ Passive acoustic monitoring with **E**cological **A**coustic **R**ecorders (EARs)

2. Micro-scale habitat use of humpback whales around Maui Nui, Hawaii

--	--	--	--	--

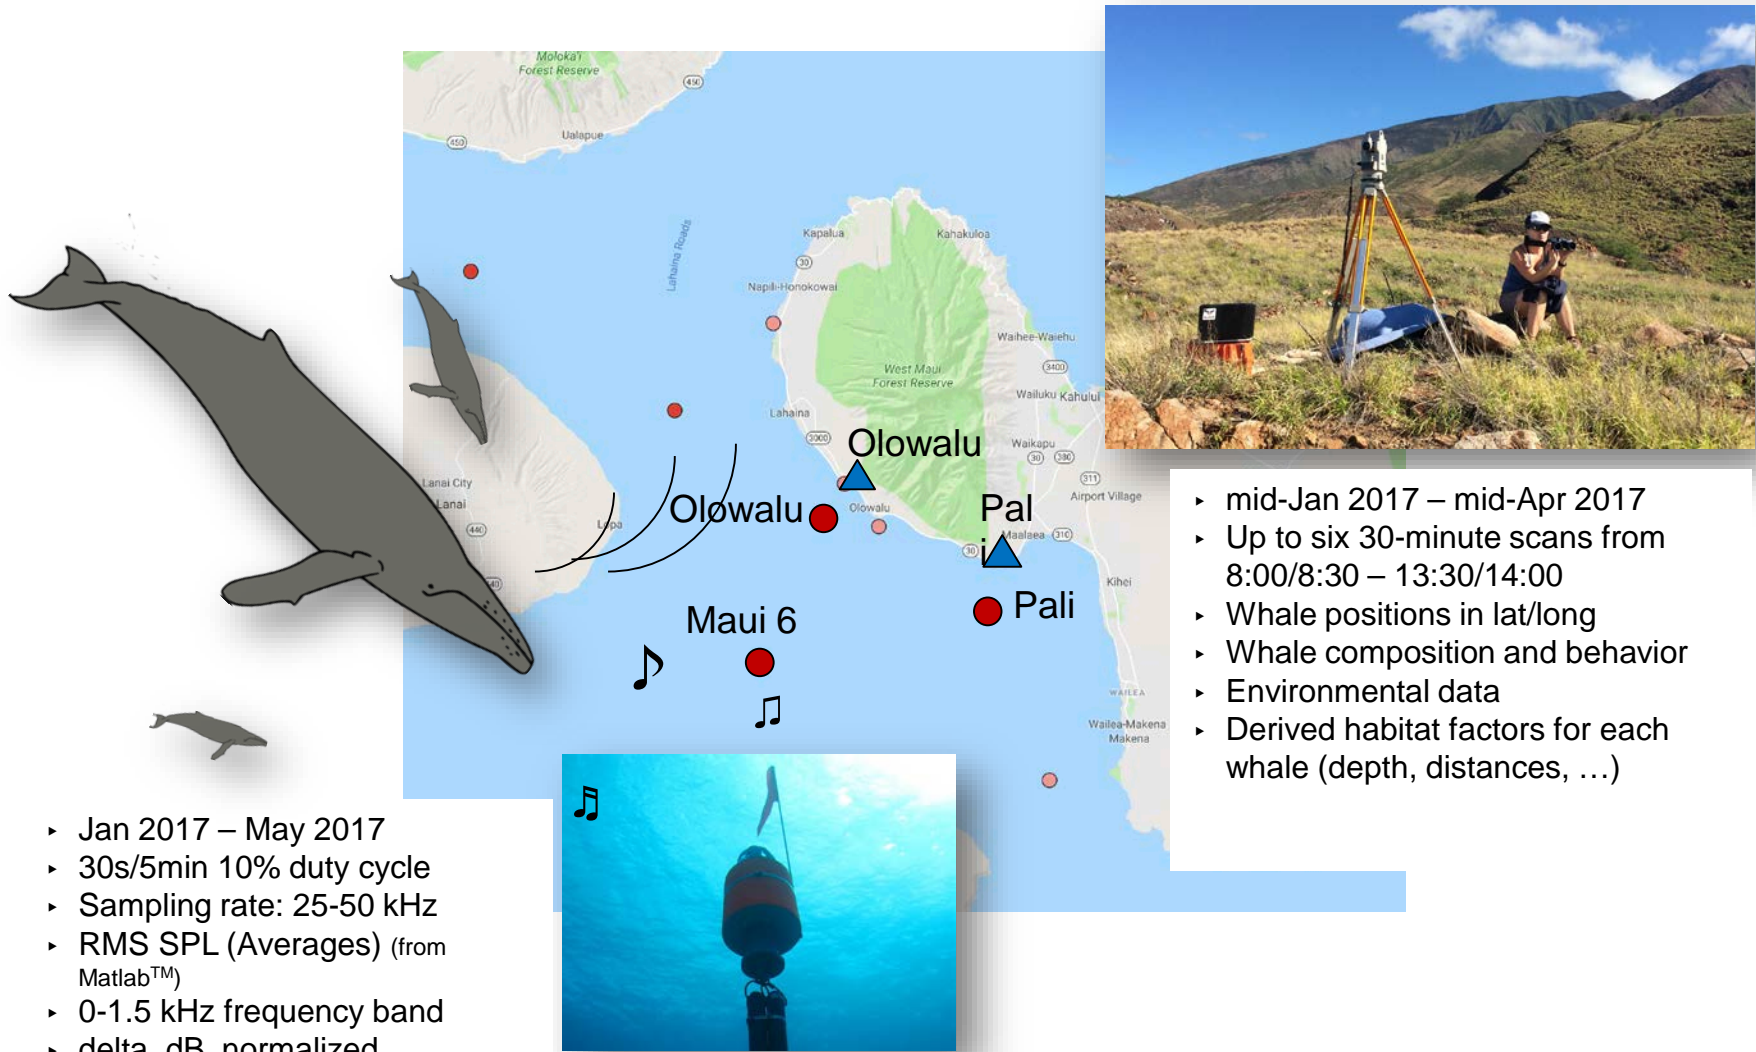

Objective

Using a multi-method approach, understand the micro-scale temporal and spatial patterns of habitat use of humpback whales in Maui Nui on two temporal scales (seasonal vs. diel)

Do whales cluster in space and/or time?

Intro	Missing Whales	<i>Maui Nui</i>	Summary/Outlook
-------	----------------	-----------------	-----------------

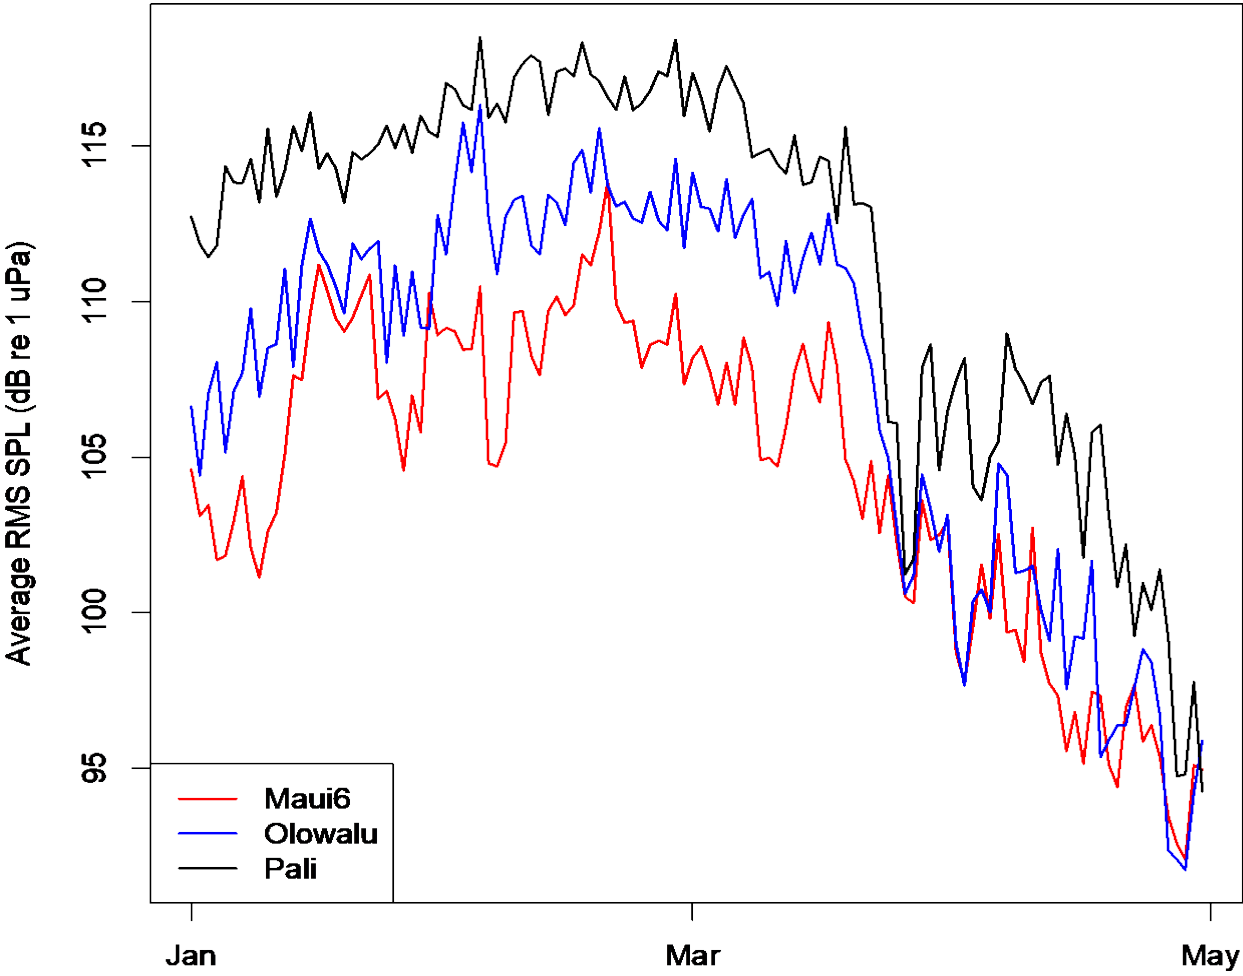

Data Collection

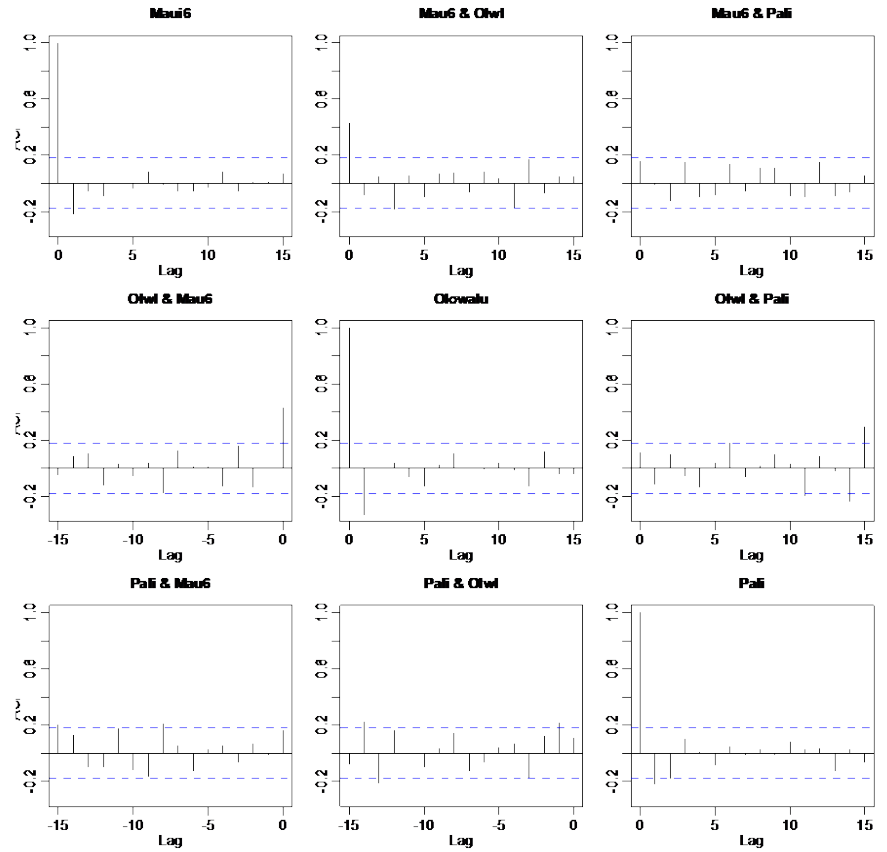

- Jan 2017 – May 2017
- 30s/5min 10% duty cycle
- Sampling rate: 25-50 kHz
- RMS SPL (Averages) (from Matlab™)
- 0-1.5 kHz frequency band
- delta_dB, normalized

- mid-Jan 2017 – mid-Apr 2017
- Up to six 30-minute scans from 8:00/8:30 – 13:30/14:00
- Whale positions in lat/long
- Whale composition and behavior
- Environmental data
- Derived habitat factors for each whale (depth, distances, ...)

Seasonal Scale

Seasonal Scale

Intro

Missing Whales

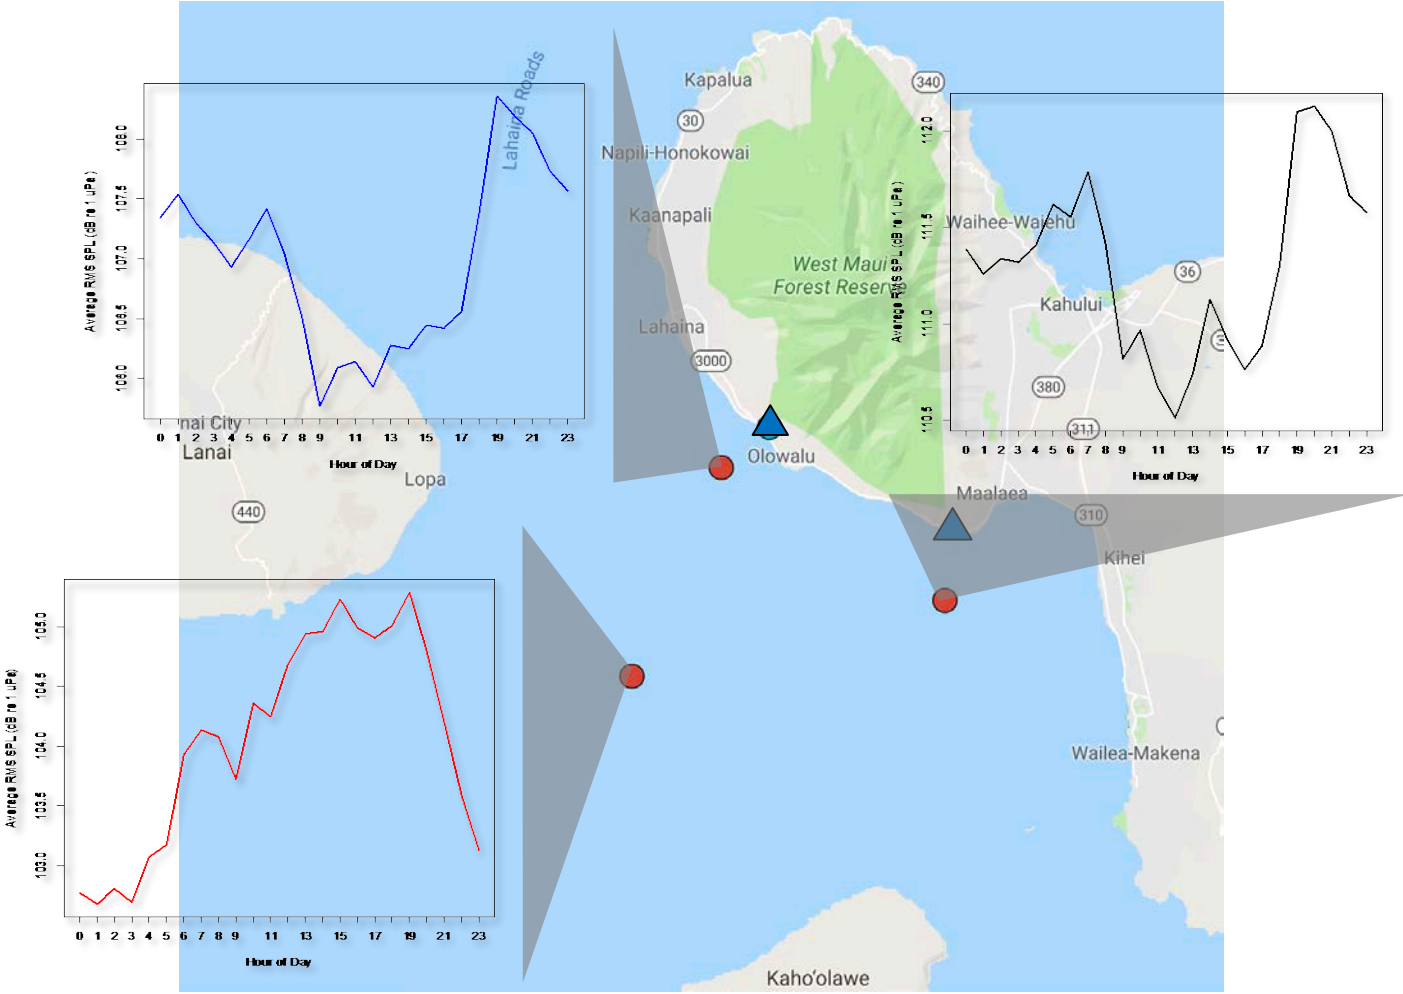

Maui Nui

Summary/Outlook

Seasonal Scale

- ▶ No clusters
- ▶ Fluid multi-site system

Diel Scale

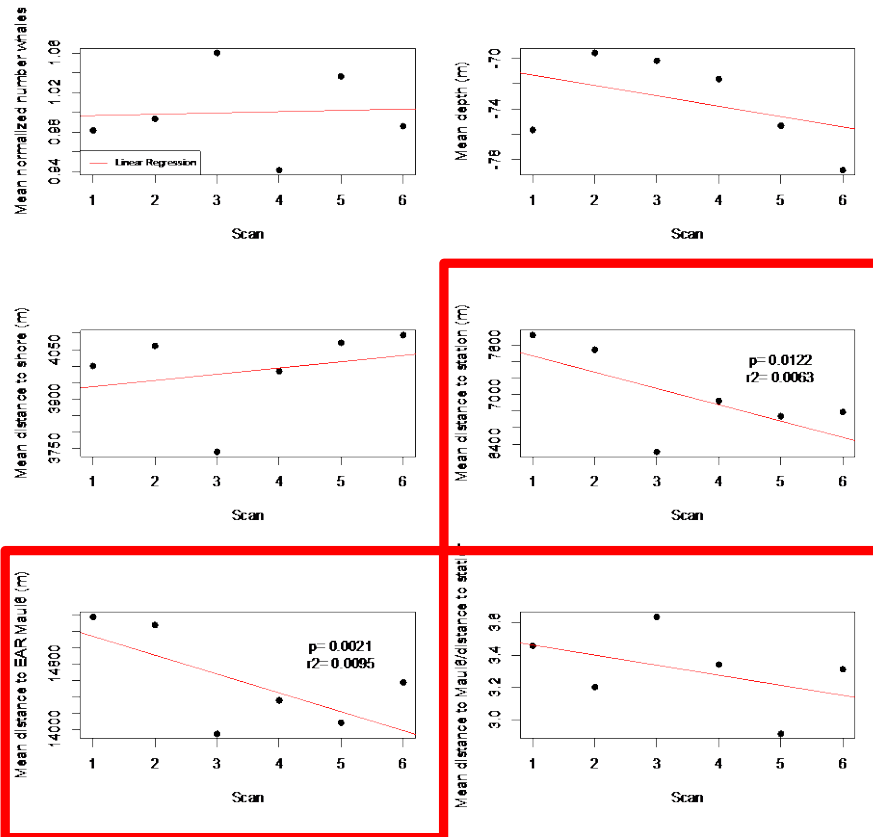

Diel Scale

- ▶ Whales move off-shore during the day
- ▶ Whales in different areas sing at different times of the day

Diel Scale

Diel patterns by hour of day (= scan number) of different mean whale observation metrics

Diel Scale

Intro

Missing Whales

Maui Nui

Summary/Outlook

Summary

- ▶ Male song chorusing mirrors the migratory pattern of humpback whales in Hawai'i
- ▶ *Assumption*: proportion of singing whales population size- independent
 Song chorus can be used as a proxy for relative whale abundance
- ▶ Handle large, longitudinal data-sets
- ▶ Easy , non-invasive and affordable tool to monitor population trends (for example vs. mark/recapture) and habitat use
- ▶ Different projects/questions with one survey effort

1. **Population trend**

- ▶ Decreasing whale song and potentially numbers since 2015/16 breeding season
- ▶ In line with citizen-science counts, reports from other breeding and feeding grounds

Summary

2. Habitat use patterns

- ▶ Seasonal pair-wise correlation among EAR sites unclear, but preliminary analysis (fluid multi-site system?)
- ▶ Strong diel acoustic patterns, would not be observed with only one recorder
- ▶ BUT: ambiguity
 - ▶ Non-vocal whales (females, calves)
 - ▶ Physical movement vs. behavior differences
- ▶ Significant decrease of distance to station and increase of distance to Maui 6 with time of day until 2pm (but GLM probably better fit than LM)

Synthesis of two methods reduced ambiguity and provides more wholesome picture

What's next

- ▶ Influence of M/c groups on observed visual correlations
- ▶ Correct data with a detection function
- ▶ Model: influence of other factors (group comp, environment...)
- ▶ **Relationship between acoustic energy (RMS SPL) and number of whales**

Analysis

Acoustics:

Approach: chorusing level is representative of relative whale abundance and reflects seasonality and diel patterns. If whales cluster and clusters move through the area, level should increase at one site while decreasing at other site with time.

- ▶ **Average RMS SPL** values per day and per hour pooled for the entire season
- ▶ Calculate **delta_dB** levels between consecutive days for each EAR site to correct for seasonality
- ▶ Pair-wise autocorrelation of delta_dB levels between sites
- ▶ Normalize **hourly averages** by mean per site and analyze pair-wise autocorrelation

Analysis

Land-data:

Approach: analyze number of sightings throughout the season and link with acoustic data for seasonal patterns. For each observation, get habitat factors and correlate with time of day (= number of scan) to investigate diel patterns.

- ▶ Normalize **daily observations** by number of scans
- ▶ Get **depths** (**package: marmap**), **distance to shore** (**package: marmap**), **distance to** respective **station** (**package: maptools/geosphere**), **distance to EAR** recorders
- ▶ ANOVA/Kruskal-Wallis for metrics ~ Scan+Date (Post-hoc Tukey HSD)
